ABSTRACT

JONES, P. D., S. C. B. RAPER, B. S. G. CHERRY, C. M. GOODESS, T. M. L. WIGLEY, B. SANTER, P. M. KELLY, R. S. BRADLEY, and H. F. DIAZ. 1991. An updated global grid point surface air temperature anomaly data set: 1851–1990. ORNL/CDIAC-37, NDP-020/R1. Carbon Dioxide Information Analysis Center, Oak Ridge National Laboratory, Oak Ridge, Tennessee. 422 pp.

This document presents land-based monthly surface air temperature anomalies (departures from a 1951–1970 reference period mean) on a 5° latitude by 10° longitude global grid. Monthly surface air temperature anomalies (departures from a 1957-1975 reference period mean) for the Antarctic (grid points from 65°S to 85°S) are presented in a similar way as a separate data set. The data were derived primarily from the *World Weather Records* and the archives of the United Kingdom Meteorological Office. This long-term record of temperature anomalies may be used in studies addressing possible greenhouse-gas-induced climate changes. To date, the data have been employed in generating regional, hemispheric, and global time series for determining whether recent (i.e., post-1900) warming trends have taken place.

This document also presents the monthly mean temperature records for the individual stations that were used to generate the set of gridded anomalies. The periods of record vary by station. Northern Hemisphere station data have been corrected for inhomogeneities, while Southern Hemisphere data are presented in uncorrected form.

All data have been assessed for quality (gross accuracy and consistency, temporal variability, and spatial and temporal completeness of record) and for long-term homogeneity. Although the period of record extends from 1851 to 1990, few grid point locations have contributed data for the entire period of record.

These data are available free of charge as a numeric data package (NDP) from the Carbon Dioxide Information Analysis Center. The NDP consists of this document and a magnetic tape containing machine-readable files (not available on floppy diskettes, due to size constraints). This document provides sample listings of temperature anomalies, station numbers, and mean inverse distance data, as well as a complete listing of the gridded surface air temperature anomalies on microfiche (Appendix B). This document also offers retrieval program listings (in FORTRAN and SAS* languages), furnishes graphical summaries and information on sampling methods and data selection, defines limitations and restrictions of the data, and provides reprints of pertinent literature.

3. KEYWORDS

Surface air temperatures, temperature anomalies, gridded temperature data, climatic trends, time series, data homogeneity

4. BACKGROUND INFORMATION

Because reliable thermometers were not developed until the mid-18th century, almost all long-term temperature records are shorter than 200 years. For the most part, the development of a large-scale temperature recording network did not begin until the early- to mid-19th century (Bradley et al. 1985). As additional stations began operating, global coverage improved. However, differences in instrumentation and calculation methods among stations and among countries have made it difficult to compile an accurate data set for global surface air temperatures. Furthermore, changes in location, in instrumentation, and in calculation methods at individual stations, as well as other factors, such as urbanization, have resulted in an inhomogeneous data set (i.e., showing jumps, discontinuities, or trends attributable to nonclimatic sources) (see, for example, Jones et al. 1986a). The data set contained and described in this package extends back to 1851 and is, to the extent possible, homogeneous. This package is an updated and expanded version of that contained in Jones et al. 1986b. These data sets are identical for the period 1851–1978; however, the updated version corrects erroneous data and adds new station data for the period 1979–1984. The updated package also extends the data set by adding data for the Northern (grid points from

85°N to 0°) and Southern (grid points from 5°S to 60°S) Hemispheres for the period 1985–1990, and, for the first time, presents Antarctic (grid points from 65°S to 85°S) data for the period 1957–1990. In addition, this package includes the monthly mean temperature records for the individual stations that were used to generate the gridded anomalies.

The gridded anomaly data were evaluated for homogeneity, by comparison with neighboring stations, and were classified as immediately usable, corrected, or uncorrectable. The results of this assessment (for data from grid points 85°N to 60°S and through 1984), including any corrections applied to the data, are presented in Jones et al. (1985, 1986c). The gridded data set was generated from the station anomalies by an interpolation procedure averaging station data that were weighted according to the inverse of the distance of the station to the nearest grid point. The gridded data are departures (anomalies) from the station means for each month over the 1951–1970 reference period, or, for the Antarctic data, the 1957–1975 reference period. It was necessary to reduce all the station data to anomalies because of different station elevations and, to a lesser extent, different observation times.

5. SOURCE AND SCOPE OF THE DATA

The basis of the data set is derived from the *World Weather Records* (WWR), published by the Smithsonian Institution (1927, 1935, and 1947) and the U.S. Weather Bureau (1959–1982). Additional data were added from material available in published and manuscript form in meteorological archives. For the Northern Hemisphere, much of the additional information came from the archives of the United Kingdom Meteorological Office. Areas where data coverage was considerably expanded include the Soviet Union, northern Europe, northern Africa, and the People's Republic of China. For the Southern Hemisphere, data were added for Argentina, Chile, Indonesia, Australia, Pacific Islands (particularly Tahiti), New Zealand, Peru, and (for 1957 onwards) some parts of Antarctica. Details of these additional sources can be found in Bradley et al. (1985) and Jones et al. (1985, 1986a) for the Northern Hemisphere and in Jones et al. (1986c, 1986d) for the Southern Hemisphere. Data for the Antarctic were assembled primarily from the *World Weather Records* and the *Monthly Climatic Data for the World.*

The present updated version of this data set is identical to the earlier version for all records from 1851 through 1978, except for the addition of a separate data set containing Antarctic (grid points from 65°S to 85°S) surface air temperature anomalies beginning in 1957. Beginning with 1979 data, this document differs from the earlier version (Jones et al. 1986b) in several ways. Erroneous data for some sites have been corrected after a review of the actual station temperature data, and inconsistencies in the representation of missing values have been removed. For some grid locations, data have been added from stations that had not contributed to the original set. Data from satellites have also been used to correct station records in cases in which large discrepancies were evident (Jones et al. 1988). The present package also extends the record by adding monthly surface air temperature anomalies for the Northern (grid points from 85°N to 0°) and Southern (grid points from 5°S to 60°S Hemispheres for the period 1985–1990.

This document also includes the monthly mean temperature records for the individua stations that were used to generate the set of gridded anomalies. The periods of record var by station, with data for 1988 being the most recent presented (although data for 1989 and 1990 were also used to generate the updated gridded anomalies). Northern Hemisphere

(stations from 87.5°N to 2.5°S) station data have been corrected for inhomogeneities, while Southern Hemisphere (stations from 2.5°S to 62.5°S) data are presented in uncorrected form and missing 5 stations (Masterton, New Zealand; Lincoln College, New Zealand; Cape Leeuwin, Australia; Cape Naturaliste, Australia; and Angururu, Australia). Further details concerning these station records, including station histories, are given in Jones et al. (1985; 1986c), copies of which are included in Appendix A. Individual station data for the Antarctic (stations south of 62.5°S) are not presented in this package but are given in Jones and Limbert (1989) and may be obtained free of charge from the Carbon Dioxide Information Analysis Center.

Analysis of these gridded surface air temperature anomaly data over the period 1881–1984 shows a linear warming trend of 0.52°C for the Northern Hemisphere (Jones et al. 1986a), and 0.51°C for the Southern Hemisphere, excluding the Antarctic (Jones et al. 1986d). A similar trends analysis incorporating the entire data set through 1990 has not yet been published.

6. APPLICATIONS OF THE DATA

A representative global data set of surface air temperatures is crucial for understanding past climatic trends and for comparing future measurements. For example, this baseline data set will be important in detecting any climate shift that may have been induced by increased concentrations of atmospheric greenhouse gases. The gridded data have been used in establishing hemispheric time series of surface air temperatures (e.g., Fig. 6, Jones et al. 1986c; Fig. 5, Jones et al. 1986a). The methods used to calculate spatial mean surface air temperatures differ among researchers, particularly in regard to averaging procedures and the extrapolation of extant data to data-poor areas (e.g., Wigley et al. 1985). When used in estimating global mean temperatures, these data are often combined with data for sea surface temperatures (SST) and, preferably, corrected for the effects of El Niño/Southern Oscillation (ENSO) events (see, for example, Jones 1988).

7. LIMITATIONS AND RESTRICTIONS

Although the data are calculated, stored, and presented in this data set to an accuracy of 0.01°C (0.1°C for Antarctic data), the individual monthly grid point anomalies are probably only accurate to at best ±0.2°C, given the accuracy of the original data (see Jones et al. 1985). The size of this error decreases, however, as averages for larger and larger regions are calculated.

Homogeneity of the data was checked by comparison with data from adjacent stations; not all station histories were examined. Thus, it is possible that some inhomogeneities could have escaped detection if a group of stations were affected similarly by a non-climatic factor.

Interstation comparisons were based on annual means, rather than on monthly means. It is possible, then, that an inhomogeneity due to urbanization could have remained undetected if a season-specific effect was not identified in the annual data. More detail on the measures taken to improve the homogeneity of the data set can be found in Appendix A. An assessment of the effect of urban warming on hemispheric average temperature anomalies derived from this data set is given in Jones et al. (1989).

The data set suffers from large discontinuities in both temporal and spatial coverage (Figs. 1–9). During the period 1900–1988, for example, nearly 60% of all contributing grid locations lack 10 or more years of data. Spatially, coverage is particularly poor before 1900. In 1851, for example, temperature anomaly data are available for only 48 grid loci, virtually all north of the equator; the entire Southern Hemisphere is represented by a single grid point, using data from a single station (Fig. 6). Jones et al. (1986d) considers the Southern Hemisphere data to be reliable only back to about 1890 for making annual hemispheric estimates and back to about 1860 for estimating overall trends. Even in 1990, however, large spatial gaps exist in the data set (Fig. 9). In the Southern Hemisphere, there is a complete lack of data from a number of grid locations in South America and central Africa. In the Northern Hemisphere, data for high-latitude locations are sparse, and there are a number of gaps in temperate regions, including two grid locations in the continental United States (resulting from the rejection of some station data during the 1980s due to urbanization effects). Considering the overall sparsity of polar data and the low weighting factor usually assigned to high-latitude data in generating area average temperature series (e.g., Jones et al. 1985), the result is likely to be an effective omission of high latitude data from such area average series. However, on the basis of the consistency of findings derived from satellite data and from surface data, Jones and Wigley (1990) have argued that incomplete coverage does not seriously affect the quality of surface temperature data.

Although each grid point temperature anomaly serves as an average value for all stations nearest to that grid point, many of the gridded anomalies use data from a single station. In 1990, for example, over half of all grid point temperature anomalies were based (as a monthly average) on data from one station. Even in 1960, the year in which the number of contributing stations was at a maximum, over 40% of all grid point anomalies were based on single station data.

In cases for the period 1979–84 in which the updated data contained in this document involve a change in the number of stations contributing to a grid point temperature anomaly, no corresponding changes were made to the associated mean inverse distance values. In these instances, therefore, the mean inverse distance data presented in this document must be assumed to be incorrect.

9. DATA CHECKS PERFORMED BY CDIAC

The Carbon Dioxide Information Analysis Center (CDIAC) endeavors to provide quality assurance (QA) of all data before their distribution. To ensure the highest possible quality in the data, CDIAC conducts extensive reviews for reasonableness, accuracy, completeness, and consistency of form. While having common objectives, the specific form of these reviews must be tailored to each data set; the process may involve considerable programming efforts. The entire QA process is an important part of CDIAC's effort to ensure that accurate, usable CO_2-related data are available to researchers.

The following summarizes the QA checks performed on the gridded surface air temperature data by CDIAC.

1. The format of all information, including header items, was checked to ensure consistency throughout each data file. Inconsistencies discovered either within the data set or between the original version and the present updated version include: (1) the presence of an extraneous line length record, not present in the earlier version of the data set, at the beginning of each line; and (2) inconsistencies in the form in which the year of record was presented within the data set.

2. All records were compared with the corresponding records (where available) in the original version to cite changes made to the updated version. These changes are summarized in Fig. 10.

3. The spatial and temporal continuity of the gridded temperature data set was reviewed, along with the corresponding data on the number of contributing stations. These results are summarized in Figs. 1–9.

4. Range and variability checks were performed on the temperature anomaly data to ensure reasonableness. The variability of the temperature data for years 1851–1990, is shown in Fig. 11.

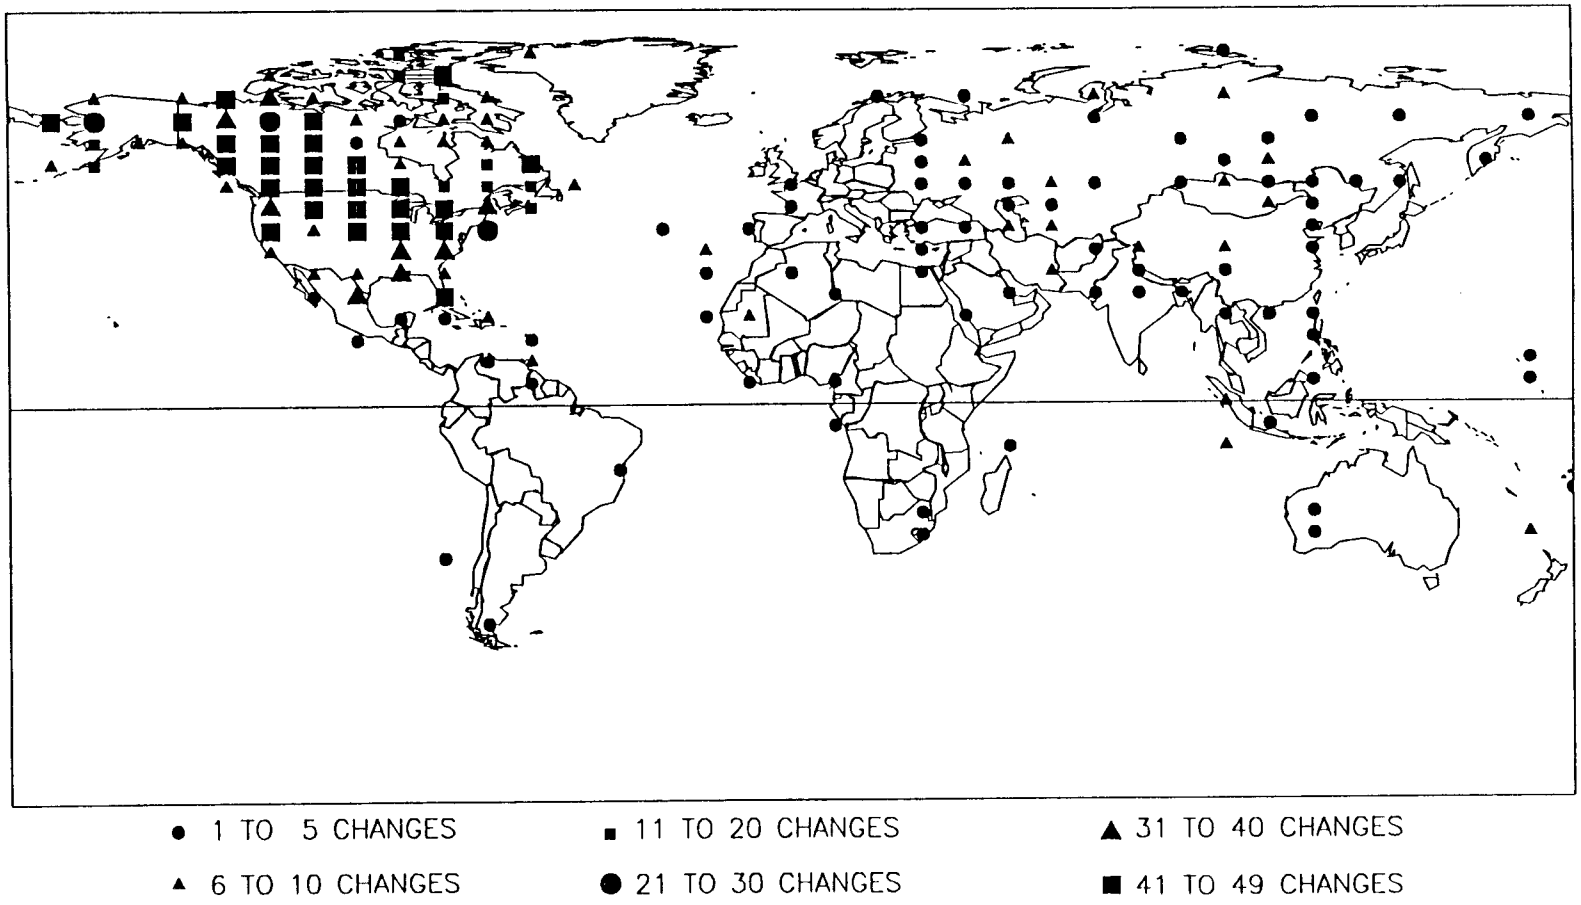

Fig. 10. Number of months per grid point location for which changes were made in the updated data set for the period 1979 to 1984.

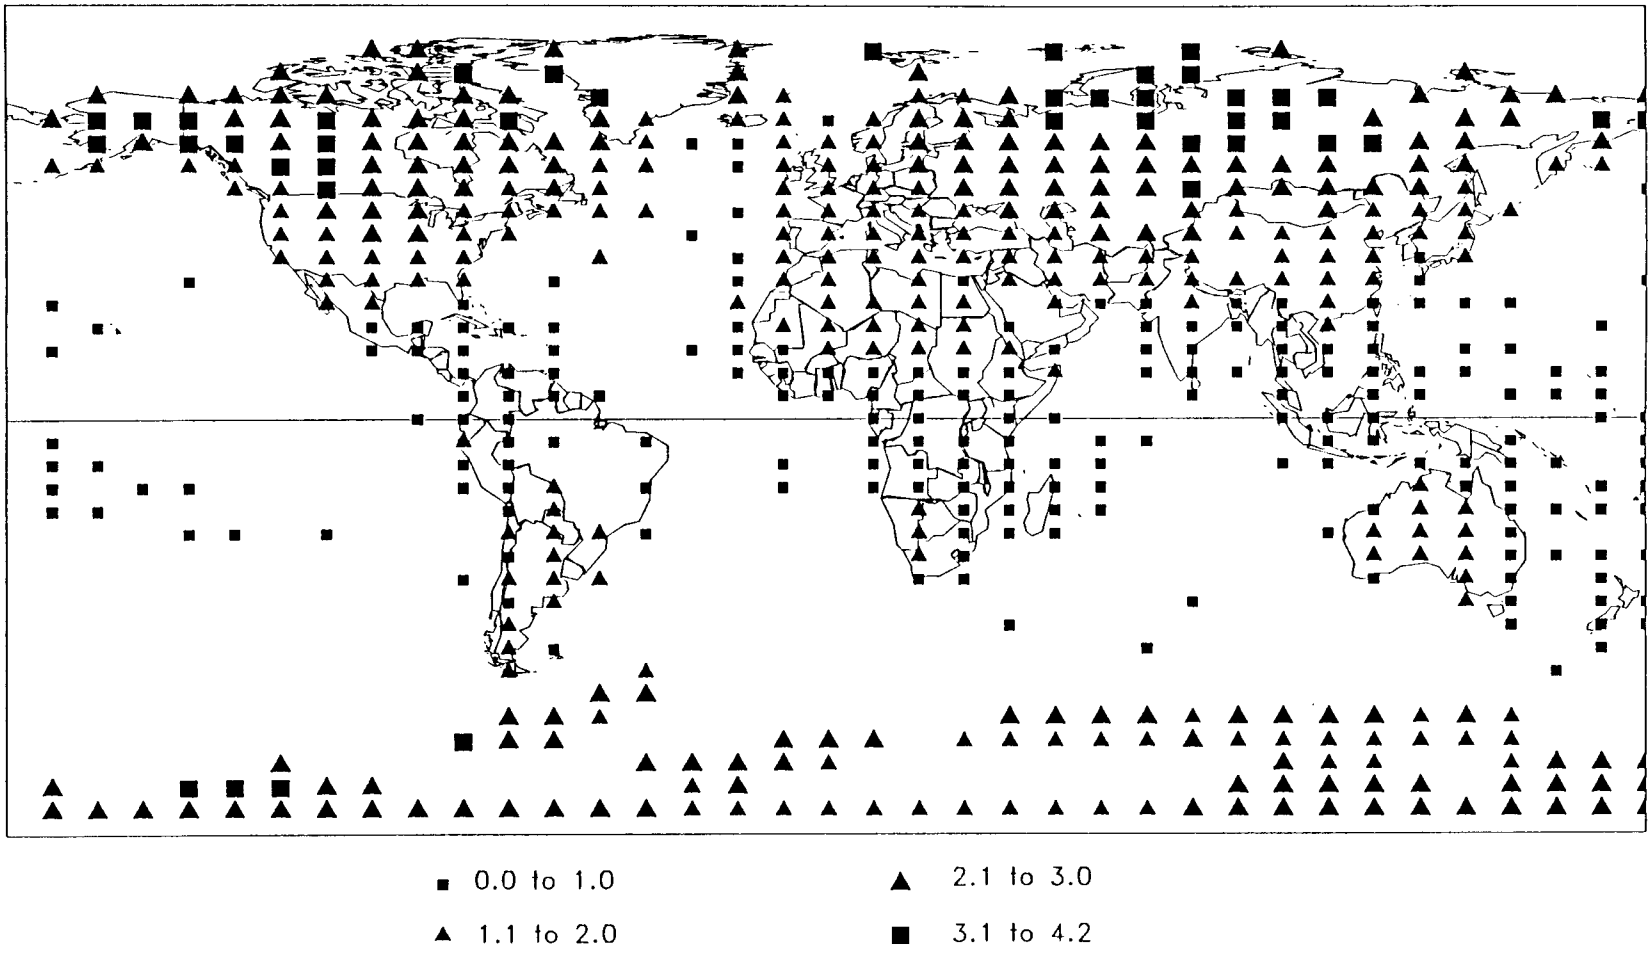

Fig. 11. Variability in monthly temperature anomaly data for each grid point location over the period 1851 to 1990. Numbers represent standard deviations (in degrees Celsius).

It is not the task of CDIAC to make alterations or deletions to the values of data it receives. Therefore, aside from the elimination of inconsistencies and redundancies in header items described in item 1 above, the surface air temperature anomaly files distributed by CDIAC in this package are identical to the original files sent to CDIAC.

Packaging of the monthly mean temperature records for individual stations required the merging of a number of separate files and the correction of incomplete or inconsistent header information. In addition, each data record, containing the 12 monthly mean temperatures for a given year, was appended with a summary value representing the mean of the 12 monthly values. No alterations have otherwise been made to any of the monthly data values contained in these files. Therefore, any limitations present in these data (e.g., the lack of corrections for inhomogeneities and the absence of data for 5 stations in the Southern Hemisphere) reflect those present in the original files obtained by CDIAC.

10. HOW TO OBTAIN THE PACKAGE

This document describes a data set consisting of the departures of 1851–1990 surface air temperatures from the mean of the 1951–1970 reference period, expressed on a global 10° longitude grid by 5° latitude grid, covering latitudes from 85°N to 60°S. Antarctic (65°S to 85°S) data are similarly presented as a separate data set consisting of the departures of 1957–1990 surface air temperatures from the mean of the 1957–1975 reference period. These data are provided on microfiche (inside back cover) in the package and are available upon request on nine-track magnetic tapes from CDIAC. Also described is a data set consisting of the actual monthly mean temperature records for individual stations from which the set of gridded departures (anomalies) were derived. Requests for magnetic tapes should include any specific instructions for transmitting the data required by the user to access the data. Requests not accompanied by specific instructions will be filled on nine-track, 6250 BPI, standard-labeled tapes with characters written in EBCDIC (Extended Binary Codes Decimal Interchange Code) and files formatted as noted in Section 11. Because of the size of the data files (12–20 MB), it is not feasible to distribute these data on floppy diskettes, even as compressed files. Requests should be addressed to the following:

Carbon Dioxide Information Analysis Center
Oak Ridge National Laboratory
Post Office Box 2008
Oak Ridge, Tennessee 37831-6335
U.S.A.

The tapes and documentation can be ordered by telephone, fax machine, or electronic mail.

PART 2

INFORMATION ABOUT THE MAGNETIC TAPE

11. CONTENTS OF THE MAGNETIC TAPE

The following is a list of files distributed on magnetic tape by CDIAC along with this documentation.

File number and description	Number of logical records	Record format[a]	Block size	Record length
1. General descriptive information file	361	FB	8000	80
2. FORTRAN IV data retrieval code to read and print the gridded surface air temperature anomaly data file for the Northern Hemisphere (File 10)	56	FB	8000	80
3. FORTRAN IV data retrieval code to read and print the gridded surface air temperature anomaly data file for the Southern Hemisphere (File 11)	56	FB	8000	80
4. FORTRAN IV data retrieval code to read and print the gridded surface air temperature anomaly data file for the Antarctic (File 12)	42	FB	8000	80
5. FORTRAN IV data retrieval code to read and print the monthly mean temperature records for individual stations (Files 13 and 14)	27	FB	8000	80

File number and description	Number of logical records	Record format[a]	Block size	Record length
6. SAS[b] input/output routine to read and print the gridded surface air temperature anomaly data file for the Northern Hemisphere (File 10)	102	FB	8000	80
7. SAS[b] input/output routine to read and print the gridded surface air temperature anomaly data file for the Southern Hemisphere (File 11)	82	FB	8000	80
8. SAS[b] input/output routine to read and print the gridded surface air temperature anomaly data file for the Antarctic (File 12)	35	FB	8000	80
9. SAS[b] input/output routine to read and print the monthly mean temperature records for individual stations (Files 13 and 14)	24	FB	8000	80
10. Gridded surface air temperature anomalies for the Northern Hemisphere, 1851–1990	186,480	FB	5400	108
11. Gridded surface air temperature anomalies for the Southern Hemisphere, 1851–1990	186,480	FB	8000	80
12. Gridded surface air temperature anomalies for the Antarctic, 1957-1990	15,096	FB	8000	80

File number and description	Number of logical records	Record format[a]	Block size	Record length
13. Monthly mean temperature records for individual stations in the Northern Hemisphere (corrected)	116,931	FB	8000	80
14. Monthly mean temperature records for individual stations in the Southern Hemisphere (uncorrected and 5 stations[c] missing)	16,738	FB	8000	80
Total records	522,510

SOURCE AND SCOPE OF THE DATA

The data files included on this magnetic tape provide gridded surface air temperature anomaly data for a total of 486 grid cells in the Northern and Southern Hemispheres (latitudes from 85°N to 60°S), and an additional 100 grid cells in the Antarctic (latitudes from 65°S to 85°S). Each grid cell represents an area of 5° latitude by 10° longitude. These data are derived from temperature records of land-based stations for the period 1851–1990, except for the Antarctic data, where the period is 1957–1990. The gridded data are departures (anomalies) from the station means for each month over the 1951–1970 reference period, or, for the Antarctic data, the 1957–1975 reference period. It was necessary to reduce all the station data to anomalies because of different station elevations and, to a lesser extent, different observation times.

The primary sources of these data are the *World Weather Records* (WWR), published by the Smithsonian Institution and the U.S. Weather Bureau, the archives of the United Kingdom Meteorological Office, and the *Monthly Climatic Data for the World*, published by the National Climatic Data Center (Asheville, North Carolina). Additional sources are

described in Bradley et al. (1985) and in Jones et al. (1985, 1986a, 1986c, 1986d). The present updated version of this data set is identical to the earlier version (Jones et al. 1986b) for all records from 1851 through 1978. For the period 1979–1984, the present data set corrects erroneous data using satellite data for some sites and appends data for other sites by adding previously unavailable station data (Jones et al. 1988). The present package also adds monthly surface air temperature anomalies for the period 1985–1990, Antarctic monthly surface air temperature anomalies for the period 1957–1990, as well as the monthly mean temperature records for individual stations (Antarctic stations excluded) that were used to generate the set of gridded anomalies. Individual station data for the Antarctic (stations south of 62.5° S) are not presented in this package but are given in Jones and Limbert (1989) and may be obtained free of charge from the Carbon Dioxide Information Analysis Center.

DATA FORMAT

Fourteen files are provided on this magnetic tape, including this descriptive file, four FORTRAN IV and four SAS data retrieval programs, three data files containing gridded surface air temperature anomaly data, and two files containing the monthly mean temperature records for individual stations.

Gridded Anomaly Data, Northern Hemisphere

The data file containing the gridded surface air temperature anomaly data for the Northern Hemisphere (File 10) is formatted in the following way:

```
      INTEGER I, J, YEAR, MONTH, ANOM(18), NSTA(18), IDIST(18)
   10 READ (5,100,END=999) YEAR, MONTH
      DO 20 I=1,36
        READ (5,200) (ANOM(J), J=1,18)
   20 CONTINUE
      READ (5,100) YEAR, MONTH
      DO 30 I=1,36
        READ (5,200) (NSTA(J), J=1,18)
   30 CONTINUE
      READ (5,100) YEAR, MONTH
      DO 40 I=1,36
        READ (5,200) (IDIST(J), J=1,18)
   40 CONTINUE
      GOTO 10
  100 FORMAT (20X,I4,4X,I2)
  200 FORMAT (18(1X,I5))
```

where

YEAR is the year of the data record being read;

MONTH is the month of the data record being read;

ANOM is the gridded surface air temperature anomaly in degrees Celsius, multiplied by 100;

NSTA is the number of stations used to calculate the gridded anomaly;

IDIST is 10,000 times the mean value (for all contributing stations) of the inverse of the great circle distance between the station and the grid point;

I represents the data line being read (each of the 36 lines of data represents a 10° longitude band, centered on 0°, 10°E, 20°E, ..., 170°E, 180°, 170°W, ..., 10°W);

J represents the data column being read (each of the 18 columns of data represents a 5° latitude band, centered on 85°N, 80°N, ..., 5°N, 0°);

Missing values for the temperature anomalies are represented by -9999. Missing values for the number of stations and mean inverse distances are represented by 0.

Gridded Anomaly Data, Southern Hemisphere

The data file containing the gridded surface air temperature anomaly data for the Southern Hemisphere (File 11) is formatted in the following way:

```
      INTEGER I, J, YEAR, MONTH, ANOM(12), NSTA(12), IDIST(12)
   10 READ (5,100,END=999) YEAR, MONTH
      DO 20 I=1,36
        READ (5,200) (ANOM(J), J=1,12)
   20 CONTINUE
      READ (5,100) YEAR, MONTH
      DO 30 I=1,36
        READ (5,200) (NSTA(J), J=1,12)
   30 CONTINUE
      READ (5,100) YEAR, MONTH
      DO 40 I=1,36
        READ (5,200) (IDIST(J), J=1,12)
   40 CONTINUE
      GOTO 10
  100 FORMAT (20X,I4,4X,I2)
  200 FORMAT (12(1X,I5))
```

where

YEAR is the year of the data record being read;

MONTH is the month of the data record being read;

ANOM is the gridded surface air temperature anomaly in degrees Celsius, multiplied by 100;

NSTA is the number of stations used to calculate the gridded anomaly;

IDIST is 10,000 times the mean value (for all contributing stations) of the inverse of the great circle distance between the station and the grid point;

I represents the data line being read (each of the 36 lines of data represents a 10° longitude band, centered on 0°, 10°E, 20°E, ..., 170°E, 180°, 170°W, ..., 10°W);

J represents the data column being read (each of the 12 columns of data represents a 5° latitude band, centered on 5°S, 10°S, ..., 60°S);

Missing values for the temperature anomalies are represented by -9999. Missing values for the number of stations and mean inverse distances are represented by 0.

Gridded Anomaly Data, Antarctic

The data file containing the gridded surface air temperature anomaly data (anomalies only — no information concerning the number of stations and the mean inverse distances) for the Antarctic (File 12) is formatted in the following way:

```
      INTEGER I, J, YEAR, MONTH, ANOM(5)
   10 READ (5,100,END=999) YEAR, MONTH
      DO 20 I=1,36
        READ (5,200) (ANOM(J), J=1,5)
   20 CONTINUE
      GOTO 10
  100 FORMAT (20X,I4,4X,I2)
  200 FORMAT (5(1X,I5))
```

where

YEAR is the year of the data record being read;

MONTH is the month of the data record being read;

ANOM is the gridded surface air temperature anomaly in degrees Celsius, multiplied by 100;

I represents the data line being read (each of the 36 lines of data represents a 10° longitude band, centered on 0°, 10°E, 20°E, ..., 170°E, 180°, 170°W, ..., 10°W);

J represents the data column being read (each of the 5 columns of data represents a 5° latitude band, centered on 65°S, 70°S, 75°S, 80°S, 85°S);

Missing values for the temperature anomalies are represented by -9999.

Monthly Mean Temperature Data for Individual Stations

The data files containing the monthly mean temperature records for individual stations (Files 13 and 14) are each formatted as

```
      INTEGER ID, LAT, LONG, ALT, TYPE, STYEAR, ENDYEAR,
     1    QCCODE, FRYEAR, J
      CHARACTER STATION*19, NATION*12, YEAR*4, TEMP(12)*4,
     1    TMEAN*4
   10 READ (5,500,END=100) ID, LAT, LONG, ALT, STATION, NATION,
     1          TYPE, STYEAR, ENDYEAR, QCCODE, FRYEAR
      YEAR='INIT'
   20 IF (YEAR.EQ.'    ') THEN
        GOTO 10
      ELSE
        READ (5,600) YEAR, (TEMP(J),J=1,12), TMEAN
        GOTO 20
      END IF
  500 FORMAT (1X,I6,1X,I4,1X,I5,1X,I5,1X,A19,1X,A12,1X,I1,1X,I4,
     1    1X,I4,1X,I2,1X,I4)
  600 FORMAT (1X,A4,12(1X,A4),2X,A4)
```

where

ID is the station identification number given by the World Meteorological Organization (WMO);

LAT is the latitude of the station (north is positive), multiplied by 10;

LONG is the longitude of the station (west is positive), multiplied by 10;

ALT is the altitude of the station in meters above sea level;

STATION is the station name;

NATION is the country in which the station is located;

TYPE is an integer code whose value indicates whether data entries are temperature ('1') or precipitation ('2');

STYEAR is the first year for which temperature records are given;

ENDYEAR is the most recent year for which temperature records are given;

QCCODE is the quality control code (see Jones et al. 1985);

FRYEAR is the first year for which reliable data is available (see Jones et al. 1985);

YEAR is the year of the data record being read;

TEMP is the monthly temperature value in degrees Celsius, multiplied by 10. Temperature values for Northern Hemisphere stations (File 13) have been corrected for inhomogeneities, while those for Southern Hemisphere stations (File 14) are uncorrected;

J represents the data column being read. Each of the 12 columns of data represents the average temperature for one month (January - December);

TMEAN is the mean of the 12 monthly temperatures in degrees Celsius, multiplied by 10;

Missing values for the monthly temperatures are represented by -999. In cases where one or more monthly temperatures are missing, values for the mean of the 12 monthly temperatures are given as -999. Missing values for latitude and altitude are represented by -999. Missing values for longitude are represented by -1999.

File 13 contains the monthly temperature data (corrected for inhomogeneities) for stations in the Northern Hemisphere (87.5°N to 2.5°S). File 14 contains the monthly temperature data (uncorrected) for stations in the Southern Hemisphere (2.5°S to 62.5°S), with the following 5 stations missing: Masterton, New Zealand; Lincoln College, New Zealand; Cape Leeuwin, Australia; Cape Naturaliste, Australia; and Angururu, Australia.

13. LISTINGS OF THE FORTRAN IV DATA RETRIEVAL PROGRAMS

The following is a listing of the FORTRAN IV data retrieval program provided on magnetic tape (File 2) by CDIAC to read and print the gridded surface air temperature anomaly file for the Northern Hemisphere (File 10—see Table 1 for a partial listing of this file). The job control language (JCL) statements shown below are not provided in the file on the magnetic tape. The JCL statements required will vary for each individual requesting these data. The JCL statements shown below are provided to illustrate the statements that would be required by an individual at ORNL who has requested these data on a nine-track, 6250 BPI, standard-labeled tape with characters written in EBCDIC and is attempting to read the tape on an IBM mainframe (e.g., IBM 3090).

14. LISTING OF THE SAS INPUT/OUTPUT RETRIEVAL PROGRAM

The following is a listing of the SAS data retrieval program provided on magnetic tape (File 6) by CDIAC to read and print the gridded surface air temperature anomaly file for the Northern Hemisphere (File 10). The JCL statements shown below are not provided in the file on the magnetic tape. The JCL statements required will vary for each individual requesting these data. The JCL statements shown below are provided to illustrate the statements that would be required by an individual at ORNL who has requested these data on a nine-track, 6250 BPI, standard-labeled tape with characters written in EBCDIC and is attempting to read the tape on an IBM mainframe (e.g., IBM 3090).

```

The following is a listing of the SAS data retrieval program provided on magnetic tape (File 9) by CDIAC to read and print either of the monthly mean temperature records for individual stations (Files 13 and 14). The JCL statements shown below are not provided in the file on the magnetic tape. The JCL statements required will vary for each individual requesting these data. The JCL statements shown below are provided to illustrate the statements that would be required by an individual at ORNL who has requested these data on a nine-track, 6250 BPI, standard-labeled tape with characters written in EBCDIC and is attempting to read the tape on an IBM mainframe (e.g., IBM 3090).

15. VERIFICATION OF DATA TRANSPORT

The data files containing the gridded surface air temperature anomalies and the mean monthly temperatures for individual stations can be read by using the FORTRAN or SAS input/output routines provided. Users should verify that the data have been correctly transported to their systems by generating some or all of the statistics presented in Tables 6 through 10. These statistics were generated in SAS (PROC MEANS) but can be duplicated in other statistical packages or languages. If the statistics generated by the user differ from those presented here, the data sets may have been corrupted in transport.

These statistics are presented only as a tool to ensure proper reading of the data sets. They are not to be construed as summarizing these data.

Table 6. Characteristics of numeric variables for the gridded surface air temperature anomaly file for the Northern Hemisphere

Variable	Number of observations	Mean	Minimum value	Maximum value
YEAR	1680	1920.500	1851.000	1990.000
MONTH	1680	6.500	1.000	12.000
MTEMP	1680	-6884.168	-9305.241	-4497.821
MSTA	1680	1.073	0.130	2.350
MDIST	1680	37.603	6.370	405.093

The following is a listing of the SAS program used to generate the statistics described in the table.

MTEMP	1680	-8612.954	-9975.947	-7094.181
MSTA	1680	0.243	0.002	0.639
MDIST	1680	10.671	0.106	22.512

The following is a listing of the SAS program used to generate the statistics described in the table.

```
DATA SUMSTATS(KEEP=YEAR MONTH MTEMP MSTA MDIST);
     INFILE 'NDP020R1.SHEM90.ANOM';
     INPUT YEAR 21-24 MONTH 29-30 #2 @2 (T1-T432)(:5.) #39 @2
          (S1-S432) (:5.) #76 @2 (D1-D432)(:5.);
     ARRAY TEMP(432) T1-T432;
     ARRAY STA(432) S1-S432;
     ARRAY DIST(432) D1-D432;
     SUMTEMP=0;
     SUMSTA=0;
     SUMDIST=0;
     DO I=1 TO 432;
          SUMTEMP=SUMTEMP+TEMP(I);
          SUMSTA=SUMSTA+STA(I);
          SUMDIST=SUMDIST+DIST(I);
     END;
     MTEMP=SUMTEMP/432;
     MSTA=SUMSTA/432;
     MDIST=SUMDIST/432;
PROC MEANS DATA=SUMSTATS MAXDEC=3;
     VAR YEAR MONTH MTEMP MSTA MDIST;
RUN;
```

Table 8. Characteristics of numeric variables for the gridded surface air temperature anomaly file for the Antarctic

Variable	Number of observations	Mean	Minimum value	Maximum value
YEAR	408	1973.500	1957.000	1990.000
MONTH	408	6.500	1.000	12.000
MTEMP	408	-5183.105	-9999.000	-4330.278

The following is a listing of the SAS program used to generate the statistics described in the table.

```
DATA SUMSTATS(KEEP=YEAR MONTH MTEMP);
     INFILE 'NDP020R1.ANTARC.ANOM';
     INPUT YEAR 21-24 MONTH 29-30 #2 @2 (T1-T180)(:5.);
     ARRAY TEMP(180) T1-T180;
     SUMTEMP=0;
     DO I=1 TO 180;
          SUMTEMP=SUMTEMP+TEMP(I);
     END;
     MTEMP=SUMTEMP/180;
PROC MEANS DATA=SUMSTATS MAXDEC=3;
     VAR YEAR MONTH MTEMP;
RUN;
```

Table 9. Characteristics of numeric variables for the monthly mean temperature records for individual stations in the Northern Hemisphere

Variable	Number of observations	Mean	Minimum value	Maximum value
ID	1584	538993.548	10010.000	999060.000
LAT	1584	355.812	-23.000	825.000
LONG	1584	157.770	-1799.000	1795.000
YEAR	113763	1934.064	1701.000	1988.000
TMEAN	113763	-136.370	-999.000	318.000

The following is a listing of the SAS program used to generate the statistics described in the table.

```
DATA SUMSTATS;
            INFILE 'NDP020R1.NHEMST.DATA';
            INPUT X $ 5 Y $ 6 @;
            IF X NE ' ' AND Y NE ' ' THEN
              INPUT ID 2-7 LAT 9-12 LONG 14-18;
            ELSE IF X NE ' ' AND Y EQ ' ' THEN
              INPUT YEAR 2-5 TMEAN 68-71;
            ELSE INPUT;
PROC MEANS MAXDEC=3 DATA=SUMSTATS;
      VAR ID LAT LONG YEAR TMEAN;
RUN;
```

Table 10. Characteristics of numeric variables for the monthly mean temperature records for individual stations in the Southern Hemisphere

Variable	Number of observations	Mean	Minimum value	Maximum value
ID	288	827340.538	619000.000	999006.000
LAT	288	-238.736	-608.000	-26.000
LONG	288	-124.083	-1791.000	1800.000
YEAR	16163	1947.656	1787.000	1988.000
TMEAN	16163	-55.135	-999.000	296.000

The following is a listing of the SAS program used to generate the statistics described in the table.

```
DATA SUMSTATS;
            INFILE 'NDP020R1.SHEMST.DATA';
            INPUT X $ 5 Y $ 6 @;
            IF X NE ' ' AND Y NE ' ' THEN
              INPUT ID 2-7 LAT 9-12 LONG 14-18;
            ELSE IF X NE ' ' AND Y EQ ' ' THEN
              INPUT YEAR 2-5 TMEAN 68-71;
            ELSE INPUT;
PROC MEANS MAXDEC=3 DATA=SUMSTATS;
      VAR ID LAT LONG YEAR TMEAN;
RUN;
```
